Abstract: This study aims to analyze and explain the effects of reputation, service quality, and price perception on repurchase intention for Galeri 24 precious metals, with customer satisfaction as an intervening variable among customers of one Galeri 24 outlet in DKI Jakarta. This study employs a quantitative approach, with a population consisting of customers who have previously purchased precious metals at one Galeri 24 outlet in DKI Jakarta. The sampling technique used was non-probability sampling, with a total sample of 193 respondents. The data used in this study consisted of primary data obtained through questionnaires and secondary data collected from various relevant sources. Data analysis was conducted using the Structural Equation Modeling–Partial Least Squares (SEM-PLS) method with the assistance of SmartPLS 3 software. The results of the study show that: (1) reputation, service quality, and price perception have a positive and significant effect on customer satisfaction; (2) customer satisfaction has a positive and significant effect on repurchase intention for precious metals; and (3) customer satisfaction positively and significantly mediates the effects of reputation, service quality, and price perception on repurchase intention for Galeri 24 precious metals among customers of one Galeri 24 outlet in DKI Jakarta.

Keyword: Reputation, Service Quality, Price Perception, Customer Satisfaction, Repurchase Intention.

INTRODUCTION

The fluctuating global economic conditions have not diminished public interest in investment. Instead, investment awareness has continued to increase, with gold becoming one of the investment instruments that attracts considerable attention. In Indonesia, gold has become an increasingly popular investment option, particularly since the COVID-19 pandemic. A survey conducted by Jakpat on July 4–6, 2022, among Indonesian respondents aged 15–44 years, reported that 87% of Indonesians had made investments. Among various investment instruments, gold and jewelry were among the most preferred, accounting for 48% of the

investment choices reported in the survey. This indicates that gold is not only viewed as a valuable commodity but also as an investment instrument for maintaining asset value and preparing for future financial needs.

The attractiveness of gold investment is also associated with developments in gold prices. Gold prices tend to fluctuate and have shown an upward movement, particularly during periods of economic uncertainty and inflation. The data indicate that increasing public awareness of investment has been accompanied by continued interest in gold despite price fluctuations. The sales value of ANTAM gold, for example, increased from IDR 11.87 trillion in the second quarter of 2021 to IDR 12.28 trillion in the second quarter of 2022. These conditions demonstrate the potential of the precious metals market in Indonesia and the importance for gold retailers to understand the factors influencing customers' purchasing decisions and repurchase intention.

The growing precious metals market has also resulted in increasingly intense competition among brands. Galeri 24 is a subsidiary of PT Pegadaian that operates in the retail gold, precious metals, and jewelry business. Established in 2018, Galeri 24 aims to become a leading retail gold, precious metals, and jewelry company in Indonesia. The company not only sells its own Galeri 24 precious metal products but also offers products from several other brands, including ANTAM, UBS, and Lotus Archi. Galeri 24 has expanded its business through 11 regional offices across Indonesia, including the DKI Jakarta Regional Office, which manages eight outlets. This expansion creates opportunities for the company but also requires it to strengthen its competitive position in the precious metals market.

One of the challenges faced by Galeri 24 is the strong market preference for the ANTAM brand. Sales data from Galeri 24 Regional DKI Jakarta for January–June 2026 show that ANTAM recorded 22,740 units, representing 56.25% of total sales, while Galeri 24 recorded 14,660 units or 36.26%. Other brands, namely UBS and Lotus Archi, accounted for 5.81% and 1.68%, respectively. These figures indicate that although Galeri 24 provides its own precious metal products, ANTAM remains the dominant brand among customers purchasing precious metals through Galeri 24 outlets. This condition suggests that Galeri 24 needs to strengthen the factors that can increase customer satisfaction and encourage customers to repurchase Galeri 24 precious metals.

In this competitive environment, reputation is an important factor in influencing customers' evaluations of precious metal products. Purchasing precious metals involves a relatively high level of financial consideration and therefore requires confidence in the credibility of the company and the authenticity of the product. A positive brand reputation can facilitate consumers' evaluation of a product, increase trust, and strengthen the likelihood that the brand will be selected. In the context of Galeri 24, reputation may be reflected through customers' perceptions of product authenticity, corporate credibility, positive corporate image, and confidence in purchasing Galeri 24 precious metals.

In addition to reputation, service quality is another factor that may influence customer satisfaction. Service quality refers to the comparison between the service delivered by a company and the customer's expectations. When the service received is lower than expected, customer interest and evaluation may decline. In the context of Galeri 24, service quality may be reflected in employee responsiveness, transaction convenience, clarity of product information, employee friendliness, and the overall purchasing experience. As a retail company operating in a competitive market, Galeri 24 needs to maintain service quality in order to provide a satisfactory customer experience.

Price perception is also relevant because customers evaluate the price paid in relation to the quality and benefits obtained. The thesis data show differences in selling prices among precious metal brands offered by Galeri 24. For several denominations, Galeri 24 precious metals were offered at relatively lower selling prices than other brands. Galeri 24 also applied a buyback policy for precious metals from different vendors, allowing customers to consider

both the purchase price and the potential value obtained when reselling their precious metals. Therefore, customers' perceptions of price may contribute to their overall evaluation of the purchasing experience and satisfaction.

Customer satisfaction is particularly important because it represents customers' overall evaluation after experiencing a product and service. When the product and service received meet or exceed expectations, customers are more likely to develop favorable evaluations and behavioral intentions. In the context of Galeri 24, customer satisfaction may subsequently encourage customers to repurchase precious metal products. Previous studies have indicated that customer satisfaction can function as an intervening mechanism between service-related and price-related factors and repurchase intention (Wicaksana & Santosa, 2022; Aminah & Dewi, 2024; Batubara et al., 2024; Soeharso, 2024). Therefore, customer satisfaction is positioned as an intervening variable in the relationship between reputation, service quality, price perception, and repurchase intention.

The preliminary survey conducted in this study further indicates the relevance of these factors. Among 30 Galeri 24 customers surveyed, 90.00% stated that price was a consideration in purchasing Galeri 24 precious metals, 86.67% considered reputation, and 93.33% considered service quality. These findings indicate that price, reputation, and service quality are perceived by customers as relevant considerations in their purchasing decisions. The preliminary findings therefore provide an initial basis for examining these three variables in relation to customer satisfaction and repurchase intention.

However, previous empirical studies have produced inconsistent findings regarding the effects of service quality and price perception on customer satisfaction and repurchase intention. Yunardi and Tjahjaningsih (2023) found that service quality and price perception had positive and significant effects on customer satisfaction, whereas Abiyyu and Tjahjaningsih (2023) reported that price perception did not significantly affect customer satisfaction. Syahdina et al. (2025) found that service quality did not significantly affect customer satisfaction, while price perception had a significant effect. Wicaksana and Santosa (2022) also examined the relationship between service quality, price perception, customer satisfaction, and repurchase intention. In the specific context of Galeri 24, Ryanto et al. (2026) found that service quality influenced customer satisfaction. These differences suggest that the effects of reputation, service quality, and price perception may vary according to the characteristics of the product, customers, and research setting.

Furthermore, research specifically examining reputation, service quality, and price perception simultaneously in relation to repurchase intention for Galeri 24 precious metals, with customer satisfaction as an intervening variable, remains limited. This is particularly relevant given the competitive condition of the precious metals market and the dominance of ANTAM in Galeri 24 Regional DKI Jakarta sales. Therefore, further empirical investigation is necessary to determine whether reputation, service quality, and price perception influence customer satisfaction and whether customer satisfaction subsequently contributes to customers' repurchase intention.

Based on these phenomena and the identified research gap, this study aims to analyze the effects of reputation, service quality, and price perception on customer satisfaction; examine the effect of customer satisfaction on repurchase intention; and investigate the indirect effects of reputation, service quality, and price perception on repurchase intention through customer satisfaction among customers of one Galeri 24 outlet in DKI Jakarta. The study is expected to contribute to the marketing management literature by providing empirical evidence regarding repurchase intention in the precious metals retail sector. Practically, the findings are expected to provide insights for Galeri 24 in developing strategies to strengthen its reputation, improve customer satisfaction, and encourage repeat purchases.

Source: Research Results
Figure 1. Research Framework

Based on the research framework, relevant theories, and previous empirical studies, the following hypotheses are formulated: H1: Reputation has a positive and significant effect on customer satisfaction. H2: Service quality has a positive and significant effect on customer satisfaction. H3: Price perception has a positive and significant effect on customer satisfaction. H4: Customer satisfaction has a positive and significant effect on repurchase intention for precious metals. H5: Reputation has a positive and significant effect on repurchase intention for precious metals through customer satisfaction as an intervening variable. H6: Service quality has a positive and significant effect on repurchase intention for precious metals through customer satisfaction as an intervening variable. H7: Price perception has a positive and significant effect on repurchase intention for precious metals through customer satisfaction as an intervening variable.

METHOD

This study employed a quantitative approach with a causal research design. The independent variables consisted of Reputation (X1), Service Quality (X2), and Price Perception (X3), while Customer Satisfaction (Z) served as the intervening variable and Repurchase Intention (Y) as the dependent variable. The study was conducted at one Galeri 24 outlet in DKI Jakarta, and data were collected from May to July 2026 through an online questionnaire.

The population of this study consisted of customers who had previously purchased precious metal products at the selected Galeri 24 outlet. Since the exact population size was unknown, the study employed non-probability sampling with a purposive sampling approach. A total of 193 respondents participated in the study. The respondents were required to be at least 18 years old, have previously purchased Galeri 24 precious metal products, have made a purchase at the selected outlet, and have completed the questionnaire in its entirety.

The research instrument employed a five-point Likert scale, ranging from 1 = strongly disagree to 5 = strongly agree. Reputation was measured through credibility, trust, corporate image/reliability, and responsibility. Service Quality was measured through tangibles, reliability, responsiveness, assurance, and empathy. Price Perception was measured through price–quality congruence, affordability, price competitiveness, and price–benefit congruence. Customer Satisfaction was measured through satisfaction with the product, satisfaction with the service, the extent to which the purchasing experience met expectations, and overall satisfaction. Repurchase Intention was measured through intention to repurchase, being the

primary choice, willingness to recommend, intention to seek information, and the tendency to choose Galeri 24 for future purchases.

Data were analyzed using Structural Equation Modeling–Partial Least Squares (SEM-PLS) with the assistance of SmartPLS 3. The evaluation of the outer model included convergent validity, discriminant validity, and reliability. Convergent validity was assessed using outer loadings and the Average Variance Extracted (AVE), while discriminant validity was assessed using the Fornell–Larcker criterion, cross-loadings, and the Heterotrait–Monotrait Ratio (HTMT). Reliability was assessed using Cronbach’s Alpha and Composite Reliability. The inner model was evaluated using R-square (R^2), effect size (f^2), and predictive relevance (Q^2). Hypothesis testing was conducted using the bootstrapping procedure at a 5% significance level, with a T-statistic > 1.96 and a P-value < 0.05 used as the criteria for statistical significance.

RESULTS AND DISCUSSION

A total of 193 respondents who met the research criteria participated in this study. The respondents consisted of 115 females (60%) and 78 males (40%). The largest age group was respondents aged 20–29 years, comprising 76 respondents (39%). In terms of educational background, respondents with a bachelor's degree (S1) represented the largest group, with 111 respondents (58%). Regarding occupation, the largest group was categorized as “others,” comprising 74 respondents (38%). The largest income group consisted of respondents with a monthly income of IDR 5,000,000–9,999,999, totaling 53 respondents (27%). Based on purchase frequency, the largest group consisted of respondents who had purchased precious metals 4–5 times, totaling 59 respondents (31%).

Table 1. Dominant Characteristics of Respondents

Characteristic	Dominant Category	n	%
Gender	Female	115	60%
Age	20-29 years	76	39%
Education	Bachelor's degree (S1)	111	58%
Occupation	Others	74	38%
Monthly income	Rp5,000,000-Rp9,999,999	53	27%
Purchase frequency	4-5 times	59	31%

Source: Research data

Descriptively, respondents provided relatively positive assessments of all constructs. For reputation, the highest mean score was found for the indicator stating that Galeri 24 is known as a trustworthy precious metal seller, with a mean score of 4.77. For service quality, the highest mean score was found for the convenience of the outlet facilities, with a mean score of 4.66. For price perception, the highest mean score was found for the conformity of price with product quality, with a mean score of 4.35, while price affordability and price–benefit congruence each obtained a mean score of 3.99. For customer satisfaction, the highest mean score was found for overall satisfaction, with a mean score of 4.72. Meanwhile, for repurchase intention, the highest mean score was found for willingness to recommend Galeri 24, with a mean score of 4.84.

Table 2. Measurement Model

Construct	Loading Range	AVE	Cronbach's Alpha	CR (rho_c)
Reputation	0.714-0.958	0.798	0.934	0.951
Service Quality	0.757-0.960	0.768	0.922	0.942
Price Perception	0.719-0.805	0.567	0.812	0.867
Customer Satisfaction	0.795-0.885	0.730	0.908	0.931

Repurchase Intention	0.792-0.905	0.711	0.899	0.925
-----------------------------	-------------	-------	-------	-------

Source: PLS Data Processing, 2026

The results of the measurement model evaluation show that all indicators have outer loading values above 0.70. The lowest outer loading value was observed for REP4 at 0.714, while the highest was observed for KP1 at 0.960. All Average Variance Extracted (AVE) values were also above 0.50, with the highest value recorded for Reputation at 0.798 and the lowest for Price Perception at 0.567. These results indicate that all constructs meet the requirements for convergent validity. Furthermore, the Cronbach's Alpha values ranged from 0.812 to 0.934, while the Composite Reliability values ranged from 0.867 to 0.951. Therefore, all constructs meet the required reliability criteria.

Table 3. Discriminant Validity Based on HTMT

Construct	CS	SQ	RI	PP	REP
Customer Satisfaction (CS)	-	0.348	0.461	0.635	0.675
Service Quality (SQ)	0.348	-	0.227	0.422	0.391
Repurchase Intention (RI)	0.461	0.227	-	0.329	0.355
Price Perception (PP)	0.635	0.422	0.329	-	0.741
Reputation (REP)	0.675	0.391	0.355	0.741	-

Source: PLS Data Processing, 2026

Discriminant validity was also established. The diagonal values of the Fornell–Larcker criterion for each construct were higher than their correlations with other constructs, and all indicators showed the highest loading on their respective constructs. Furthermore, all HTMT values were below 0.90, with the highest value of 0.741 observed between Reputation and Price Perception. These results indicate that the constructs of Reputation, Service Quality, Price Perception, Customer Satisfaction, and Repurchase Intention are sufficiently distinct from one another. Therefore, the measurement model is considered adequate for further structural model analysis.

Table 4. Structural Model

Endogenous Construct	R²	Adjusted R²	Q²
Customer Satisfaction	0.443	0.434	0.297
Repurchase Intention	0.184	0.180	0.124

Source: PLS Data Processing, 2026

The R² values indicate that Reputation, Service Quality, and Price Perception jointly explain 44.3% of the variance in Customer Satisfaction. Furthermore, Reputation, Service Quality, Price Perception, and Customer Satisfaction explain 18.4% of the variance in Repurchase Intention. The Q² values of 0.297 for Customer Satisfaction and 0.124 for Repurchase Intention, both greater than zero, indicate that the structural model has predictive relevance.

In terms of effect size, the effect of Reputation on Customer Satisfaction has an f² value of 0.185, while the effect of Customer Satisfaction on Repurchase Intention has an f² value of 0.226. Based on the interpretation used in this study, both values indicate a moderate effect. Meanwhile, the effect of Service Quality on Customer Satisfaction has an f² value of 0.010, while Price Perception has an f² value of 0.052, indicating relatively small effects.

Table 5. Hypothesis Testing

Hypothesis	Path	β	T-statistic	P-value	Decision
H1	Reputation → Customer Satisfaction	0.444	4.082	0.000	Accepted
H2	Service Quality → Customer Satisfaction	0.081	1.551	0.121	Rejected
H3	Price Perception → Customer Satisfaction	0.237	1.818	0.070	Rejected

H4	Customer Satisfaction → Repurchase Intention	0.429	5.844	0.000	Accepted
H5	Reputation → Satisfaction → Repurchase Intention	0.190	3.442	0.001	Accepted
H6	Service Quality → Satisfaction → Repurchase Intention	0.035	1.461	0.145	Rejected
H7	Price Perception → Satisfaction → Repurchase Intention	0.102	1.672	0.095	Rejected

Source: PLS Data Processing, 2026

The Effect of Reputation on Customer Satisfaction. The results show that reputation has a positive and significant effect on customer satisfaction ($\beta = 0.444$; $T = 4.082$; $P = 0.000$). This finding indicates that the better the reputation perceived by customers, the higher their satisfaction with Galeri 24 precious metal products. This result is consistent with the perspective that reputation represents important information when consumers evaluate a company and develop identification and trust toward the company (Wolter et al., 2021). In the context of precious metals, customers require confidence in product authenticity and the credibility of the seller; therefore, reputation plays an important role in shaping customers' post-purchase evaluations. This finding also supports Novita and Toar (2024), who reported a relationship between reputation and repurchase behavior. From a practical perspective, Galeri 24 needs to maintain its credibility, transparency of product information, and customer trust because these factors constitute important aspects of the purchasing experience.

The Effect of Service Quality on Customer Satisfaction. Service quality has a positive but insignificant effect on customer satisfaction ($\beta = 0.081$; $T = 1.551$; $P = 0.121$). This finding differs from several previous studies that reported a significant effect of service quality on customer satisfaction, including the study conducted on Galeri 24 by Ryanto et al. (2026), as well as studies by Aminah and Dewi (2024) and Batubara et al. (2024). In the present study, respondents nevertheless provided relatively positive assessments of service quality, with indicator mean scores ranging from 4.48 to 4.66. However, a high descriptive assessment does not necessarily indicate a statistically significant structural effect. This finding may indicate that precious metal customers place greater emphasis on reputation, trust, and confidence in the product when evaluating their satisfaction. Therefore, although service quality should be maintained, improving customer satisfaction may not be sufficiently achieved through service quality alone.

The Effect of Price Perception on Customer Satisfaction. Price perception has a positive but insignificant effect on customer satisfaction ($\beta = 0.237$; $T = 1.818$; $P = 0.070$). This finding indicates that the relationship between price perception and customer satisfaction is positive as hypothesized but does not reach the 5% significance level. This result is consistent with Abiyyu and Tjahjaningsih (2023), who found that price perception did not significantly affect customer satisfaction in their research context. However, it differs from the findings of Yunardi and Tjahjaningsih (2023), Amalia and Nurtiahiadi (2024), and Ginting and Hasibuan (2025), who reported a positive effect of price perception. In this study, respondents generally provided positive evaluations of price; however, the indicators of affordability and price–benefit congruence obtained relatively lower mean scores of 3.99. This finding suggests that customers evaluate price together with other factors, such as reputation and the overall purchasing experience. Therefore, price perception does not appear to be the primary determinant of customer satisfaction in this research context.

The Effect of Customer Satisfaction on Repurchase Intention. Customer satisfaction has a positive and significant effect on repurchase intention ($\beta = 0.429$; $T = 5.844$; $P = 0.000$). This finding confirms that a satisfactory purchasing experience can increase customers' intention to repurchase Galeri 24 precious metals. This result is consistent with Aminah and Dewi (2024), Batubara et al. (2024), and Soeharso (2024), who identified customer satisfaction as an

important factor in explaining repurchase intention. In the present study, the overall satisfaction indicator obtained a high mean score of 4.72, while repurchase intention was also positively assessed by respondents. Therefore, maintaining a purchasing experience that meets customer expectations is an important strategy for strengthening repurchase intention.

The Effect of Reputation on Repurchase Intention through Customer Satisfaction. The indirect effect of reputation on repurchase intention through customer satisfaction is positive and significant ($\beta = 0.190$; $T = 3.442$; $P = 0.001$). This finding demonstrates that a favorable reputation can contribute to customer satisfaction, which subsequently increases repurchase intention. This result represents one of the main findings of the study because it demonstrates that reputation is not only associated with customers' evaluation of the company but can also translate into post-purchase behavioral intentions through customer satisfaction. In the context of precious metals, confidence in the credibility of the company and the authenticity of its products may create a more reassuring purchasing experience, thereby increasing customers' tendency to choose Galeri 24 again.

The Effect of Service Quality on Repurchase Intention through Customer Satisfaction. The indirect effect of service quality on repurchase intention through customer satisfaction is not significant ($\beta = 0.035$; $T = 1.461$; $P = 0.145$). This finding indicates that although service quality has a positive direction of influence, the effect is not sufficiently strong to significantly contribute to customer satisfaction and subsequently encourage repurchase intention. This result differs from Batubara et al. (2024), who found a mediating role of customer satisfaction in the relationship between service quality and repurchase intention. This difference suggests that the role of service quality in encouraging repeat purchases may depend on product characteristics and customer characteristics. In the context of precious metals, customers may place greater emphasis on confidence in the company and the product than on the service experience alone.

The Effect of Price Perception on Repurchase Intention through Customer Satisfaction. Price perception does not have a significant indirect effect on repurchase intention through customer satisfaction ($\beta = 0.102$; $T = 1.672$; $P = 0.095$). This finding indicates that although price perception has a positive direction of influence, it has not been statistically proven to increase customer satisfaction and subsequently encourage repurchase intention in the research context. This finding differs from Amalia and Nurtiahiadi (2024) and Ginting and Hasibuan (2025), who identified a role for price perception in repurchase behavior through customer satisfaction. The difference in findings may indicate that in precious metal purchases, customers consider factors beyond price, particularly reputation and confidence in the product. Therefore, although pricing strategies should remain transparent and competitive, price should not be the sole focus in efforts to maintain customers' repurchase intention.

CONCLUSION

This study demonstrates that reputation has a positive and significant effect on customer satisfaction, whereas service quality and price perception do not have significant effects on customer satisfaction in the research context. Customer satisfaction has a positive and significant effect on repurchase intention. Furthermore, reputation has a positive and significant indirect effect on repurchase intention through customer satisfaction, while service quality and price perception do not have significant indirect effects through customer satisfaction. Thus, three of the seven hypotheses proposed in this study are supported.

These findings imply that Galeri 24 should prioritize maintaining its reputation and customer trust as part of its marketing strategy, particularly by strengthening corporate credibility, customer confidence in product authenticity, and the provision of clear and transparent product information. Customer satisfaction should also be continuously maintained because it has been proven to contribute to repurchase intention. Although service quality and price information remain important aspects that should be improved, the findings indicate that

they do not constitute the primary pathways for generating repurchase intention through customer satisfaction in the research context. Future studies may expand the research scope to several Galeri 24 outlets, involve a larger number of respondents, and incorporate additional variables such as customer trust, promotion, product quality, customer value, or customer experience.
